

Below is a list of good foods that will support your body to heal itself and a list of bad foods that will block vitamins and minerals from being absorbed and will also do damage to your body. If you take Dr. Wallach's suggested 90 essential vitamins and minerals daily and don't change your diet habits, then you are wasting your time and money on supplements! If you aren't strict about adhering to this diet, the supplements will not help and you will continue to be malnourished. If you are serious about your health, this lifestyle change is a must. You will then ensure you are getting the most out of your daily vitamin and mineral supplement regimen. It is easier than you think and the end result is very rewarding!

Good Foods

Eggs – Eggs should be the staple of your diet. They are considered by many as a **super food**. Not only do they contain vital cholesterol that your brain, nerves, and hormones need to function but they also contain a whole slew of proteins, EFA's, vitamins and minerals that help your body function. Dr. Wallach recommends 8-12 eggs a day (for Alzheimer's it is recommended you eat 10+eggs a day to feed your brain the cholesterol it needs to function). Do not overcook eggs, soft scramble them in butter and salt, soft boil them, poach them, or eat them raw in a smoothie. Note that there is a chance to get salmonella from the outside shell of the egg. If you eat raw eggs put a teaspoon of bleach into a quart of water with the eggs, then dry them off and they are ready to crack. The bleach will kill any microorganisms on the outside of the shell. If you hard boil an egg and the yolk has a greenish coating, this means the cholesterol has been degraded, so it's best to soft boil eggs. If you are allergic to chicken eggs then you can try goose, duck or quale eggs. Organic free range insect foraging is the best.

TO COOK EGGS YOU MAY:

- **Poach:** This is his number one choice because the water never reaches a temperature greater than 212 degrees.
- **Scramble:** With butter over very low heat and only until they are just setting up. If you can hear them cooking it's too hot.
- **Soft Boil:** With the yolk still runny. Some call them "2 minute eggs"
- **Raw Eggs:** Are good **BUT** you must increase your Biotin and take the 90 for life and make sure the shell is clean before cracking.

Iodized Salt/Sea Salt – Your body needs salt to create stomach acid and many other things. If you are on a salt restricted diet you will not be able to create stomach acid causing acid reflux/heart burn. So use as much salt as you want and salt your food to taste. Organic is best.

Butter - If you cook with butter, make sure the heat is low enough that the butter doesn't turn brown in the pan. Organic is best.

Dairy – Full fat whole milk only. No skim, 1% or 2% milk. Grass fed is the best.

Fish – Wild caught and not from Pacific Ocean is the best available option.

Chicken – Organic and free range insect foraging is the best.

Pork – Organic non-GMO fed is the best.

Lamb – Organic non-GMO fed is the best.

Beef – Rare or medium-rare only. Make sure there are no grill or char marks on your meat. The best way to cook is with a pressure cooker or crockpot. Organic non-GMO grass fed is the best.

Fruit – Do not eat fruits infected with microbes like the black spots inside bananas. Fruits are best in the daytime as not to spike sugar levels at night. The outer rinds of fruit contain healthy nutrients so rinse them off and eat or blend with your fruit. Organic non-GMO is the best.

Corn – It's a very important food to buy organic non-GMO because the extremely altered genetics ruin the digestive system.

Vegetables – Do not stir fry your vegetables (See fried foods below). Organically grown produce is not nutritionally better than conventionally grown. If you look at the **requirements to be labeled by the USDA as organic**, you will be surprised to find that the produce has to be grown from soil that has not had prohibited substances applied to it for only 3 years. So a field could have been sprayed for 50 years but if they stopped spraying it for 3 years with prohibited substances then it can be certified organic. Back in 1936 it was brought to the government's attention that our soils were horribly depleted of nutrients through **US Senate Document #264**. So no matter what you eat, organic or conventional, it is impossible to get **all 90 nutrients** your body needs every day from the foods you eat. Organic non-GMO is the best.

Nuts – Salted or mixed nuts are okay. Because most peanuts are contaminated with fungus it is recommended you do not eat them. Do not eat nuts that have been processed on the same machines as wheat. Soaking nuts is essential for proper digestion. Place in salt water overnight for 7 hours will allow the nuts to be digested properly. When eating nuts that haven't been soaked, the phytic acid binds to minerals in the gastrointestinal tract and cannot be absorbed in the intestine. Nuts are also high in enzyme inhibitors. Soaking nuts neutralizes the enzyme inhibitors allowing for proper digestion. Soaking nuts also enhances the flavor tremendously! Organic non-GMO is the best.

Nut Butters – Nut butters are fine to eat as long as they have no extra sugar or oils. You can make your own with a powerful blender. Organic non-GMO is the best.

Lard – Yes Lard is filled with essential healthy fat! Organic non-GMO is the best.

Beans – All beans are ok. Organic non-GMO is the best.

White Rice – Organic non-GMO is the best.

Brown Rice – Organic non-GMO is the best.

Millet – Organic non-GMO is the best.

Pure Buckwheat – It isn't wheat. Organic non-GMO is the best.

Couscous – Made from pure millet only. Organic non-GMO is the best.

Quinoa – Organic non-GMO is the best.

Coffee – Organic non-GMO is the best.

Tea & Green Tea – Organic non-GMO is the best.

Red Wine – Organic non-GMO is the best.

Filtered Water – Four to eight 8 oz. glasses of water daily. Avoid soft plastic bottles and BPA. Avoid drinking and cooking in tap water since most cities have many impurities and fluoridate their water. Cook with distilled water it's very affordable. Fluoride has been proven to reduce your IQ, motivation, and creativity. Recently even **Harvard Univ. has released a study linking fluoride to "significantly lower" IQ scores**. Do not drink alkaline water an hour before or hour after eating since it neutralizes your stomach acid like carbonated drinks, which prevents digestion and absorption of nutrients.

Hyperthyroidism – If you suffer from (over active thyroid) you need to eat **cruciferous vegetables** because they will suppress and reduce thyroid function. Some more common examples of cruciferous vegetables are: horseradish, collard greens, kale, cabbage, brussel sprouts, broccoli, cauliflower, bok choy, turnip, mustard seed, arugula, watercress, radish and wasabi.

Bad Food

✗ **Wheat**

✗ **Barley**

✗ **Rye**

✗ **Oats/Oatmeal** – The grains we eat today have been altered to withstand weather, insects, and weed killers resulting in a gluten protein that our stomachs just cannot break down. When the gluten travels through our intestinal track undigested, it destroys the Villi and micro Villi that is meant to absorb the nutrients from our foods. This leads to digestive, chronic health problems, and diseases. This includes some alcoholic beverages. Oatmeal has gluten as well it just goes by a different name “Gliadin”. Avoid all these grains above to ensure that are able to digest the nutrients in your diet.

✗ **Fried Food** – When you fry foods or overheat them it produces **acrylamides** and free radicals. These carcinogens lead to inflammation in your digestive track and arteries, oxidation damage to your nerves and soft tissue and cause certain cancers. This includes stir fry.

✗ **Oils** – Cooking oils, olive oils, even coconut oil oxidizes when oxygen comes into contact with it. If it has oil in the name don't use it! This includes anything made from oils like mayonnaise and salad dressing. Use salt and lemon juice as a salad dressing alternative. When you eat oxidized oil it causes inflammation, oxidation damage and destroys tissues in your body. This includes fish packed in oil and any food in oil. In nature there is no cooking oil tree, and no spigot at the base an olive tree to get oil from. So our bodies were just not designed to eat handle oils especially the mass quantities we are eating today. Steam your food, pressure cook, or cook with butter on low, if you can hear it sizzle it's too hot.

✗ **Well Done Meat (Rare or Medium Rare is ok)** – **Carcinogenic heterocyclic amines** are created by high temperature cooking of meat. Make sure that when cooking at a barbeque that you do not let the flames touch the meat, or let the juices from the meat hit the charcoal and coat it with burnt smoke. If you grill your food, try to have something between the food and the fire (like aluminum foil) so the juice doesn't drip onto the flame and deposit dangerous things on the meat. Heterocyclic amines are the most egregious cancer causing substances on earth.

✗ **Deli Meats/Cold Cuts** – Most deli meats, hot dogs, and bacon have nitrates and nitrites in them as a preservative. Nitrates and nitrites cause inflammation, tissue destruction, oxidation, and free radical damage. If you can get nitrate/nitrite free deli meats that are free from all preservatives, then you are okay to consume them.

✗ **Carbonated Beverages** – Carbonated beverages neutralize your stomach acid and reduce your ability to digest and absorb the nutrients from your food and supplements. Phosphoric acid is especially bad for you and will rob minerals from your bones.

✗ **Potato/Yam/Sweet Potatoe Skins** – The skin is ok to eat only after you boil it.

✗ **Phytates** – **Phytic acid** is most commonly found in beans, seeds and some nuts. It will bind to minerals in your foods or supplements causing them not to be absorbed by your body. To avoid this make sure you take your minerals two to three hours before or after you consume a meal with phytates. Some examples of phytates are: linseeds, sesame seeds, almonds, brazilnuts, coconuts, hazelnuts, peanuts, walnuts, corn, brown rice, polished rice, pinto beans chickpeas, hummus, lentils, soybeans, tofu, and spinach. For nuts soak them in salt water overnight for 7 hours and it will neutralize the phytic acids and enzyme inhibitors allowing for proper digestion. Soaking the nuts also enhances the flavor tremendously!

✗ **Hypothyroidism** – If you suffer from hypothyroidism (Under active thyroid) you need to avoid eating cruciferous vegetables because they will suppress and reduce thyroid function. Some more common examples of cruciferous vegetables are: horseradish, kale, collard greens, cabbage, Brussel sprouts, broccoli, cauliflower, bok choy, turnip, mustard seed, arugula, watercress, radish, and wasabi.

What is Gluten?

Gluten is the elastic protein found in the center of wheat, rye, and barley (including durum, einkorn, graham, semolina, bulgur wheat, spelt, farro, kamut, and triticale). It is also in oats but called a different name (Gliadin). This protein is too strong for humans to break down properly and ingesting this protein over many years causes a complete destruction and breakdown of the intestinal track causing Appendicitis, Bloating, Wheat Belly, Constipation, Diarrhea, Diverticulitis, Celiac Disease, Ulcerative Colitis, Crohn's Disease, Dermatitis, Psoriasis, Asthma, Eczema, Dry Skin, Gastritis, GERD, Indigestion, Pancreatitis, Upset Stomach, IBS, Diabetes, Multiple Sclerosis, Rheumatoid arthritis, Stomach Cancers and many more...

Gluten causes gut inflammation in at least 80% of the population and another 30% of the population develops antibodies against gluten proteins in the gut. Gluten's inflammatory effect in the gut causes intestinal cells to die prematurely causing oxidation of those cells. This effect creates a leaky gut and a leaky gut can allow bacterial proteins and other toxic compounds to get in the blood stream, which can also lead to autoimmune attacks on the body. A leaky gut also means that food is not digested properly and nutrients are not absorbed fully, which can lead to nutrient deficiencies

Why Avoiding Gluten is so critical

- Gluten causes inflammation
- Causes Intestinal Sludge & Blockage
- Significantly Raises Blood Sugar
- Interferes with Absorption of Vitamins and Minerals
- Associated with Auto Immune Diseases
- Effects & Disrupts Endocrine & Hormonal Systems

The Issue also lies in the fact that we need to go back to eating real food. Back to putting the emphasis on whole foods that are naturally gluten-free like meat, eggs, fish, vegetables, fruit, nuts and seeds. Eating from Boxes, Cans, and packages is one of the reasons the United States is the sickest Nation in the World. 95% of food didn't exist 40 years ago. We spend more on healthcare than all the other 204 United Nations combined. We are currently ranking 60th in Longevity, 41st in Infant Survivability, 1 out of 3 Americans are Diabetic & we are the most obese Nation in the World. It is a sad state of affairs, and then add the GMO Crops Wheat, Soy, and Corn that are 'round up' ready and the food has become hazardous to our well-being. We live in a time where mass production and preservatives have become more important than the long term problems the food is causing.

Gluten Is The Sneaky Ingredient Hiding In Many Foods

Recipes calling for breadcrumbs, breaded coatings, fried onion rings, flour dredging, bread and flat bread, croutons, bagels, croissants, flour tortillas, pizza crust, graham crackers, granola, cereal, wheat germ, wheat berries, cookie crumbs, pancake mix, pie crust pastry, crackers, pretzels, toast, flour tortillas, sandwich wraps and lavash, or pita bread are not gluten-free.

Malt Flavorings, Soy Sauce, Fried Foods (due to the breading), Beer and other grain-based alcohol, Breading, Brown rice syrup, Caramel color, Communion wafers, Couscous, Croutons, Dairy substitutes, Dextrin, Dry roasted nuts, Gravy, Herbs, Hydrolyzed vegetable protein, Imitation seafood, Licorice, Lipstick, Lip gloss, Chapstick, Luncheon meats, Malt flavoring, Matzo, Modified food starch, Wheat germ, Cracked wheat, Salad dressings, Seasonings, Soups, Bouillon, Broths, Soy sauce, Hydrolyzed wheat protein, White flour, Bran, Bromated flour, Bulgur, Durum flour, Enriched flour, Farina, Faro, Graham Flour, Matzo meal/flour, Malt or malt flavoring (can be made from barley), Malt vinegar (made from barley), Orzo, Panko, Phosphated flour, Plain flour, Rye, Seitan, Self-rising flour, Semolina, Triticale (a cross between wheat and rye), Udon, Einkorn, Emmer, Spelt, Kamut, Wheat starch, Wheat bran and if you are not sure then it is best to avoid.

Check labels on canned and prepared soups, tomato paste, sweeteners, confectioner's powdered sugar and brown sugar, prepared beverages, flavored and instant coffees, herbal teas (watch for barley), roasted, flavored or spiced nuts, jerky, flavored yogurts, puddings and ice creams, chocolate and chocolate chips, cocoa powder and instant cocoa mixes, flavored vinegars (avoid malt vinegar, and fake "balsamic" flavored vinegar), cooking wines, flavored liqueur and liquor, wine coolers (malt). Be careful with personal care products, cosmetics, vitamins and supplements that could have gluten

Always read labels. If needed call the manufacturer.

Eating out is very risky:

Be aware that deli's and restaurants often add flour to thicken soups and sauces, may add pancake mix to egg omelets, and use breadcrumbs to add 'body' to tuna salad. Gluten-free pasta might be boiled in the same water used for wheat pasta (and some kitchens blanch veggies in their glutened pasta water). Avoid French fries and fried foods fried in the same oil with wheat flour breaded foods (fried onion rings, batter coated fish, veggies, meat and chicken).

Learn about cross contamination and ask restaurants if they cook gluten free foods separate. Look for this symbol popping up in restaurants around the country. Known as the "Gluten Intolerance Group", which inspects kitchens to make sure there is no problems with cross contamination.

Gluten-Free alternative grains, flours, starches and thickeners for cooking that should be safe* include:

- Corn, grits, polenta & cornmeal
- Coconut flour
- Basmati, jasmine, sticky rice & rice cereal
- Sweet potato & yam flour
- Tapioca starch/tapioca flour (aka manioc)
- Chick pea flour, garbanzo flour, bean flour
- Cornstarch
- Chestnut flour
- Quinoa - cereal flakes, & quinoa flour
- Nut flours- almond, chestnut, pecan, cashew
- Rice flour- white rice, brown rice flour
- Buckwheat, buckwheat cereal, kasha & buckwheat flour
- Sorghum flour
- Teff flour
- Amaranth & amaranth flour
- Arrowroot Starch
- Rice- white, brown, risotto
- Millet & miller flour

*Safe if milled in a dedicated GF facility/source. Check with company to determine if they are using allergen safety protocols, and a gluten-free facility.
